Stealth System — Basic Setup

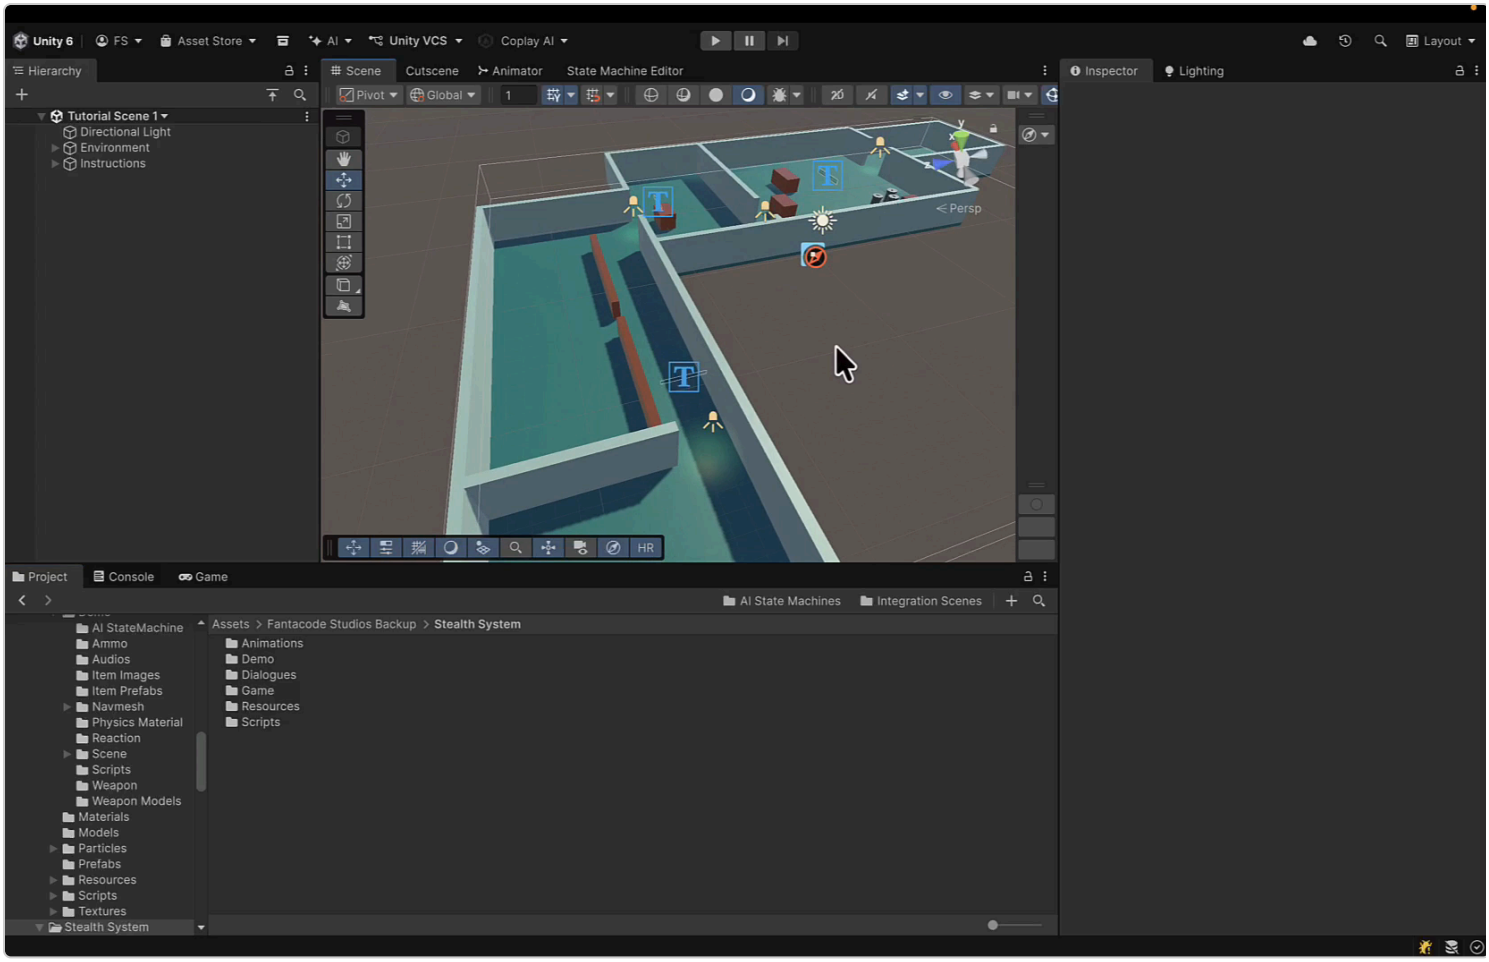

This guide walks you through the basic setup of the Stealth System — creating the player, creating a stealth AI, baking the NavMesh, and testing detection.

Contents

- Creating the Player Character
- Creating the Stealth AI
- Baking the NavMesh
- Testing Detection

Introduction

We'll start from a simple scene with just a basic environment — no characters yet. You can follow along in any scene of your own.

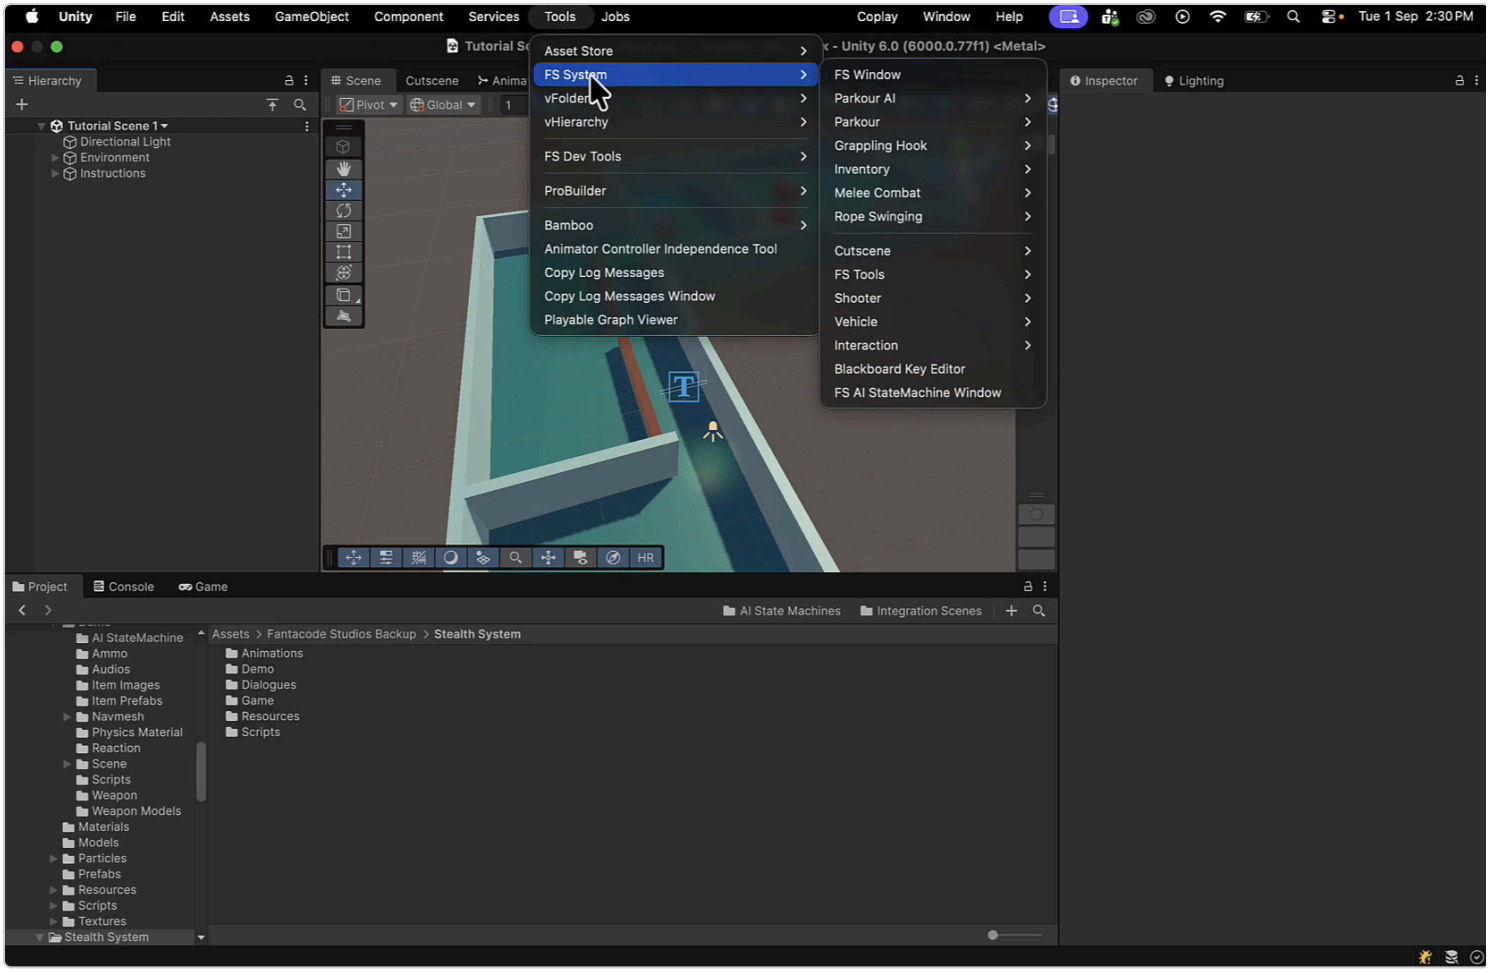

Sample scene with a basic environment

Creating the Player Character

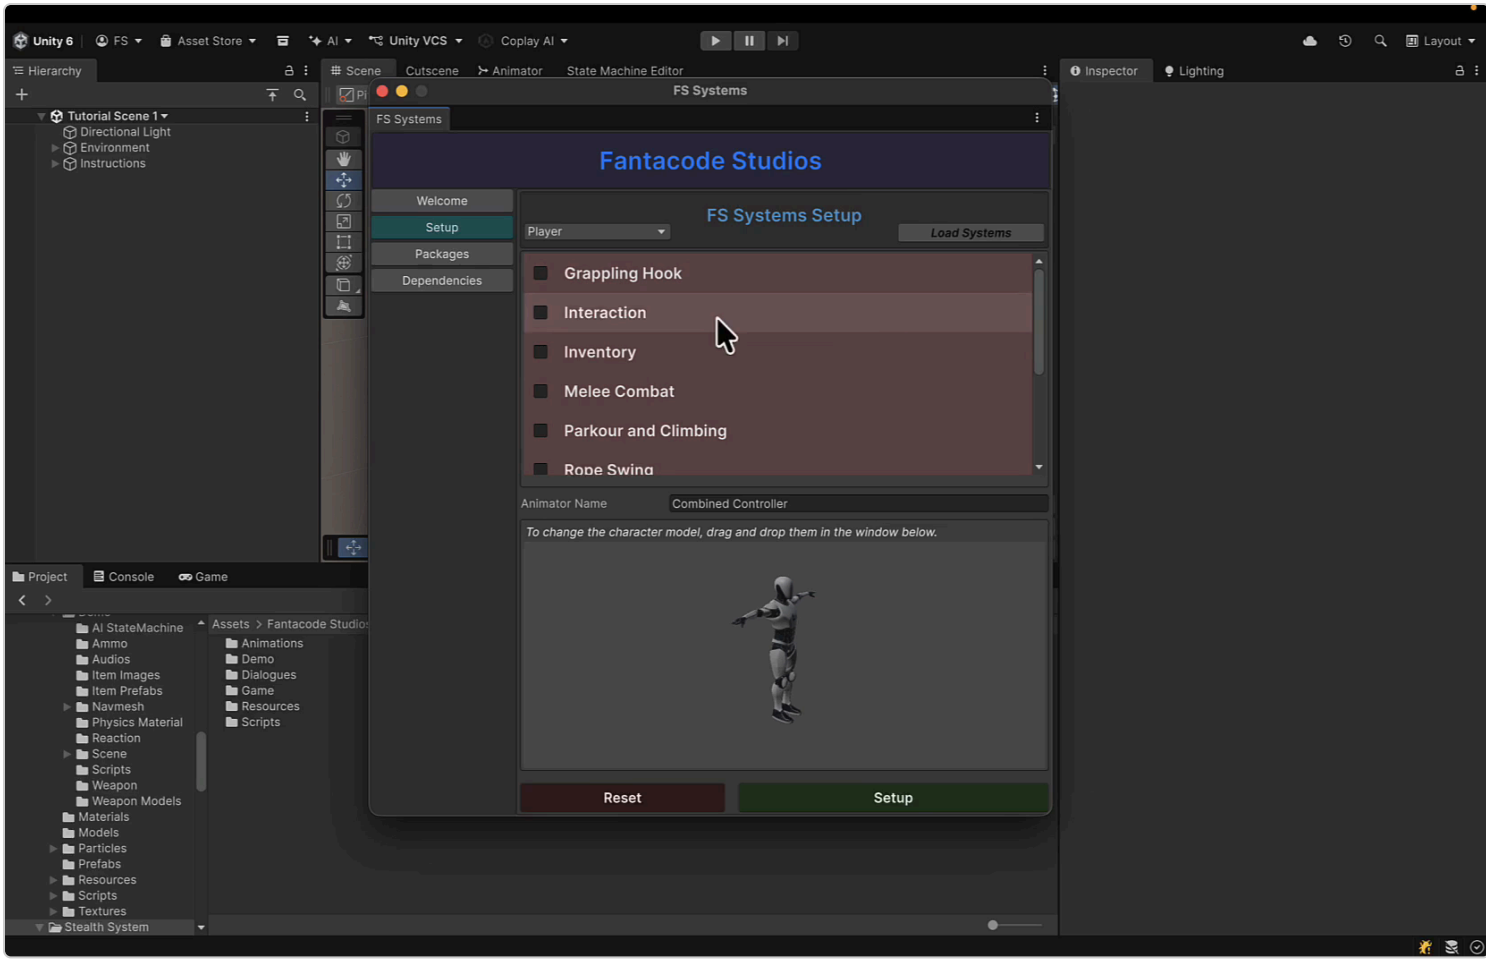

Characters are created through the **FS Systems Setup** window.

1. Open the setup window from **Tools > FS System > FS Window**.

Opening the FS Window from the Tools menu

2. In the window that opens, click the **Setup** tab. This is the setup screen used to create both player and AI characters.

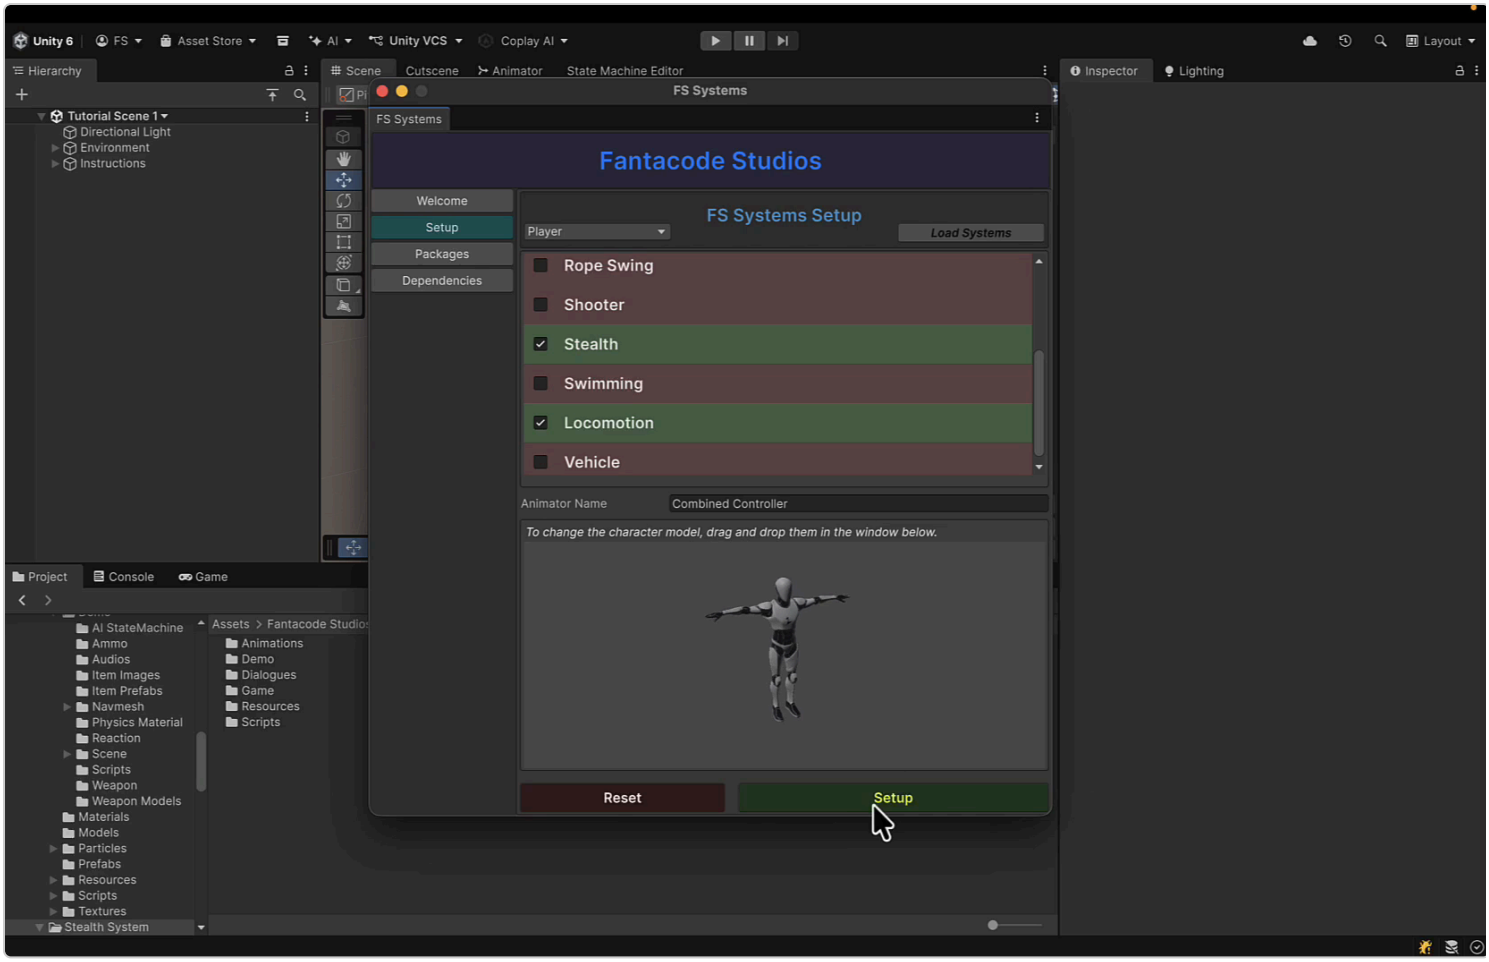

The FS Systems Setup window with the Setup tab selected

> **Note:** The list shows every FS system installed in your project. If you only have the Stealth System installed, you'll just see **Stealth** and **Locomotion** here. Other systems (Shooter, Parkour, Melee Combat, etc.) appear in this list when installed, which lets you create characters that combine functionality from multiple systems. For now we'll focus on the Stealth System — integrating it with other systems is covered in the full Getting Started guide.

3. Select **Stealth** and **Locomotion** from the list.

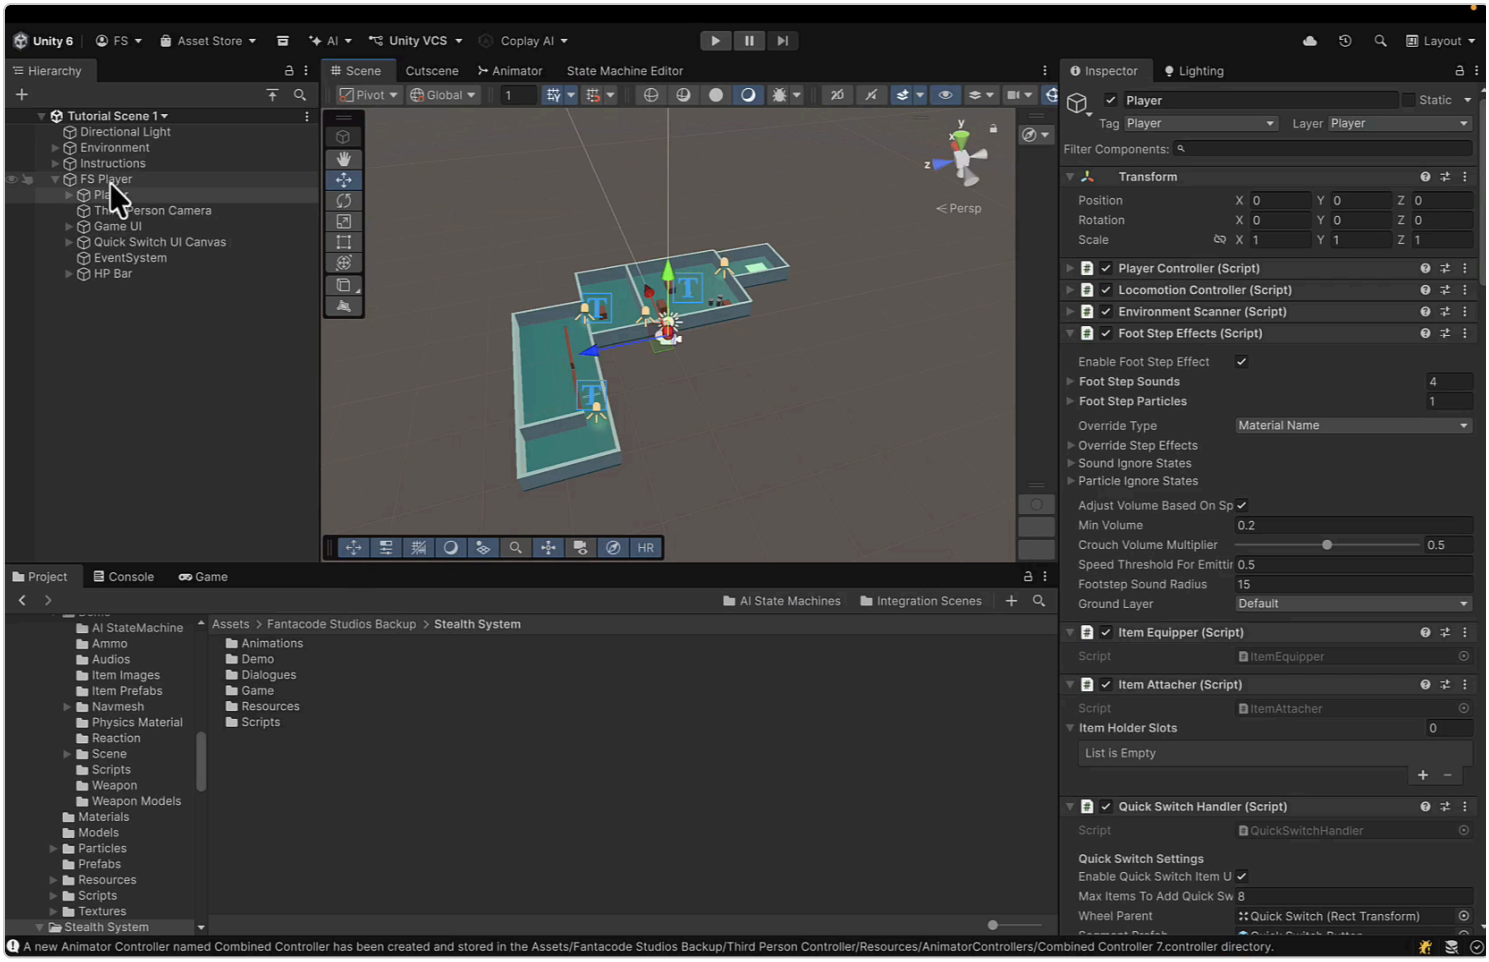

4. Optionally, change the character model by dragging your own model into the preview area at the bottom of the window. This guide uses the default character.

5. Click the **Setup** button.

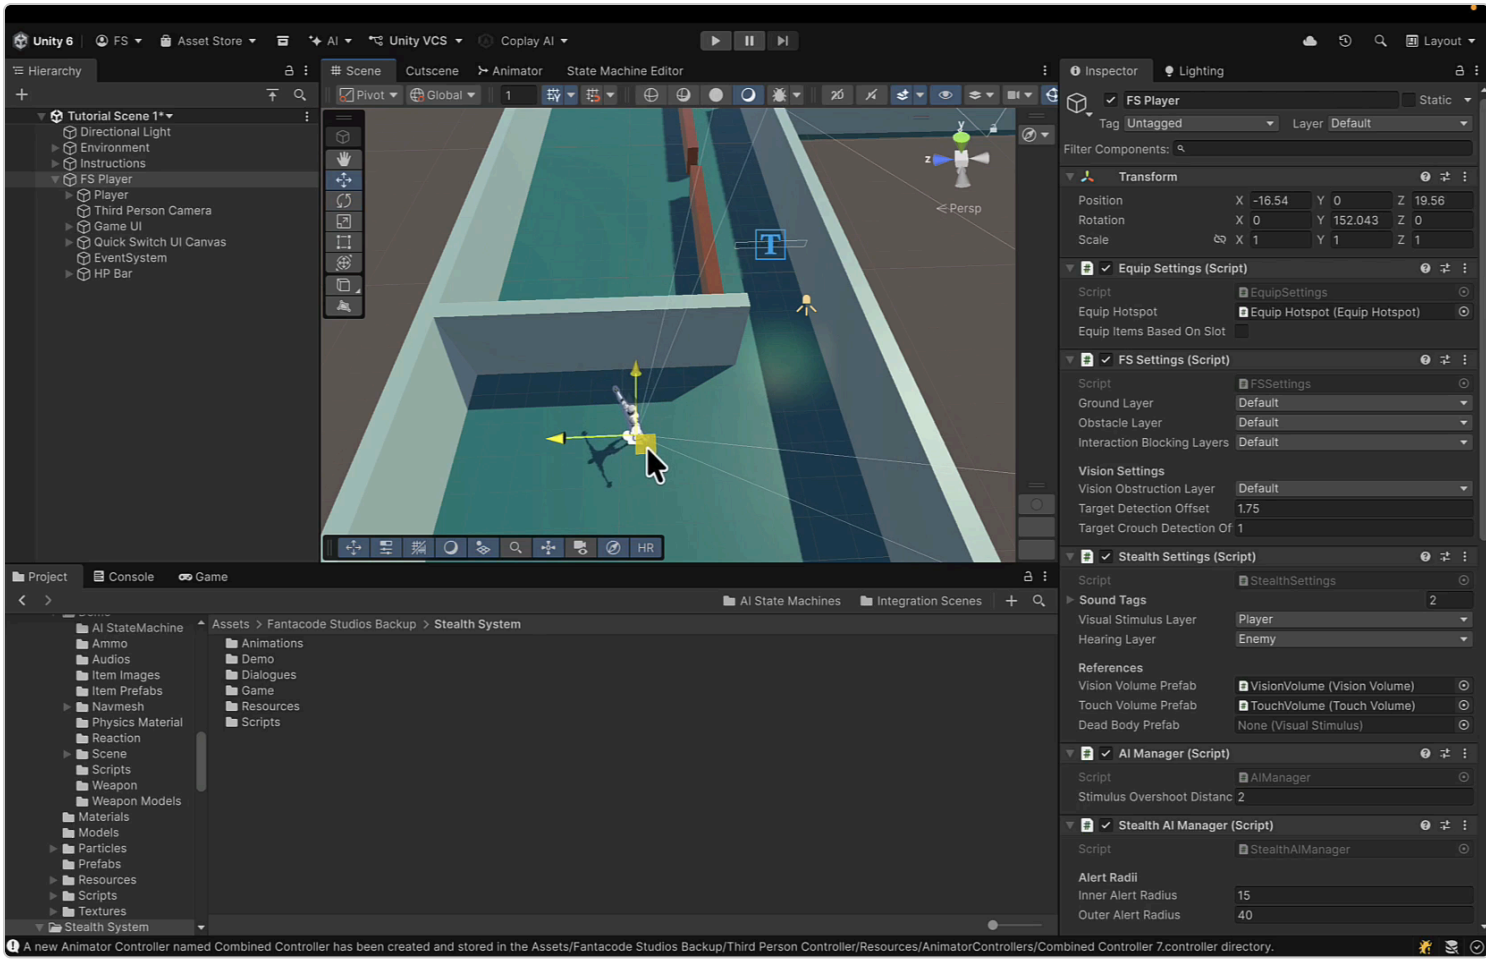

Stealth and Locomotion selected, ready to click Setup

This creates the player character with all the components required by the Stealth System, along with the camera, UI, and event system objects it needs.

The created FS Player object and its components

6. The character is created at position (0, 0, 0), so move and rotate it to wherever you want the player to start.

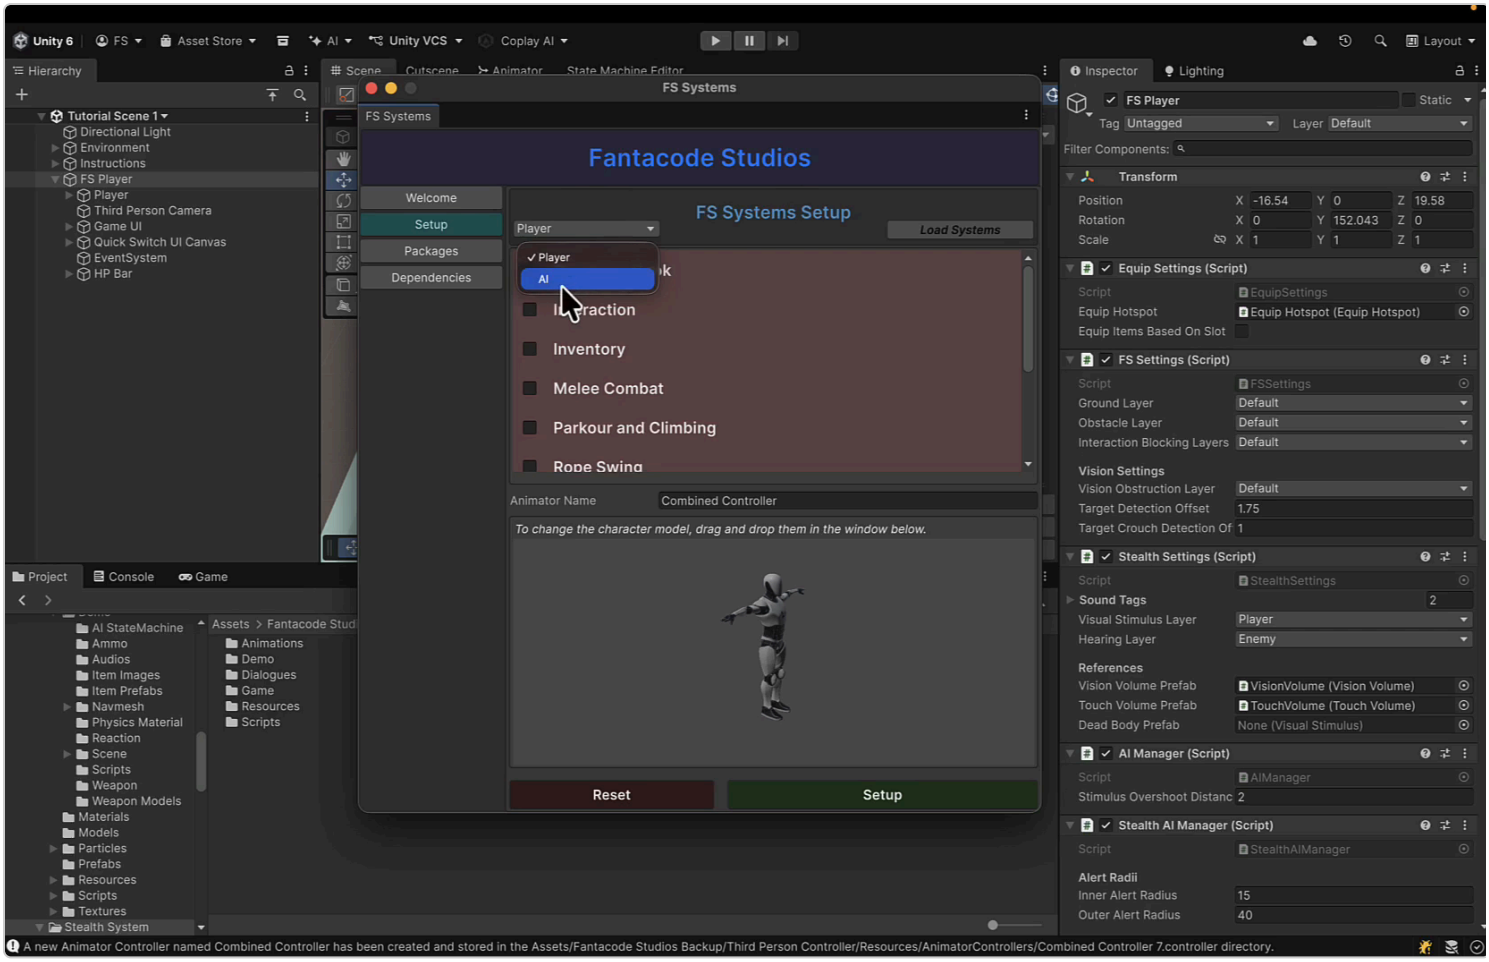

Positioning the player in the scene

Creating the Stealth AI

The AI character is created from the same setup window.

1. Open **Tools > FS System > FS Window** again and go to the **Setup** tab.

2. Change the dropdown at the top of the list from **Player** to **AI**.

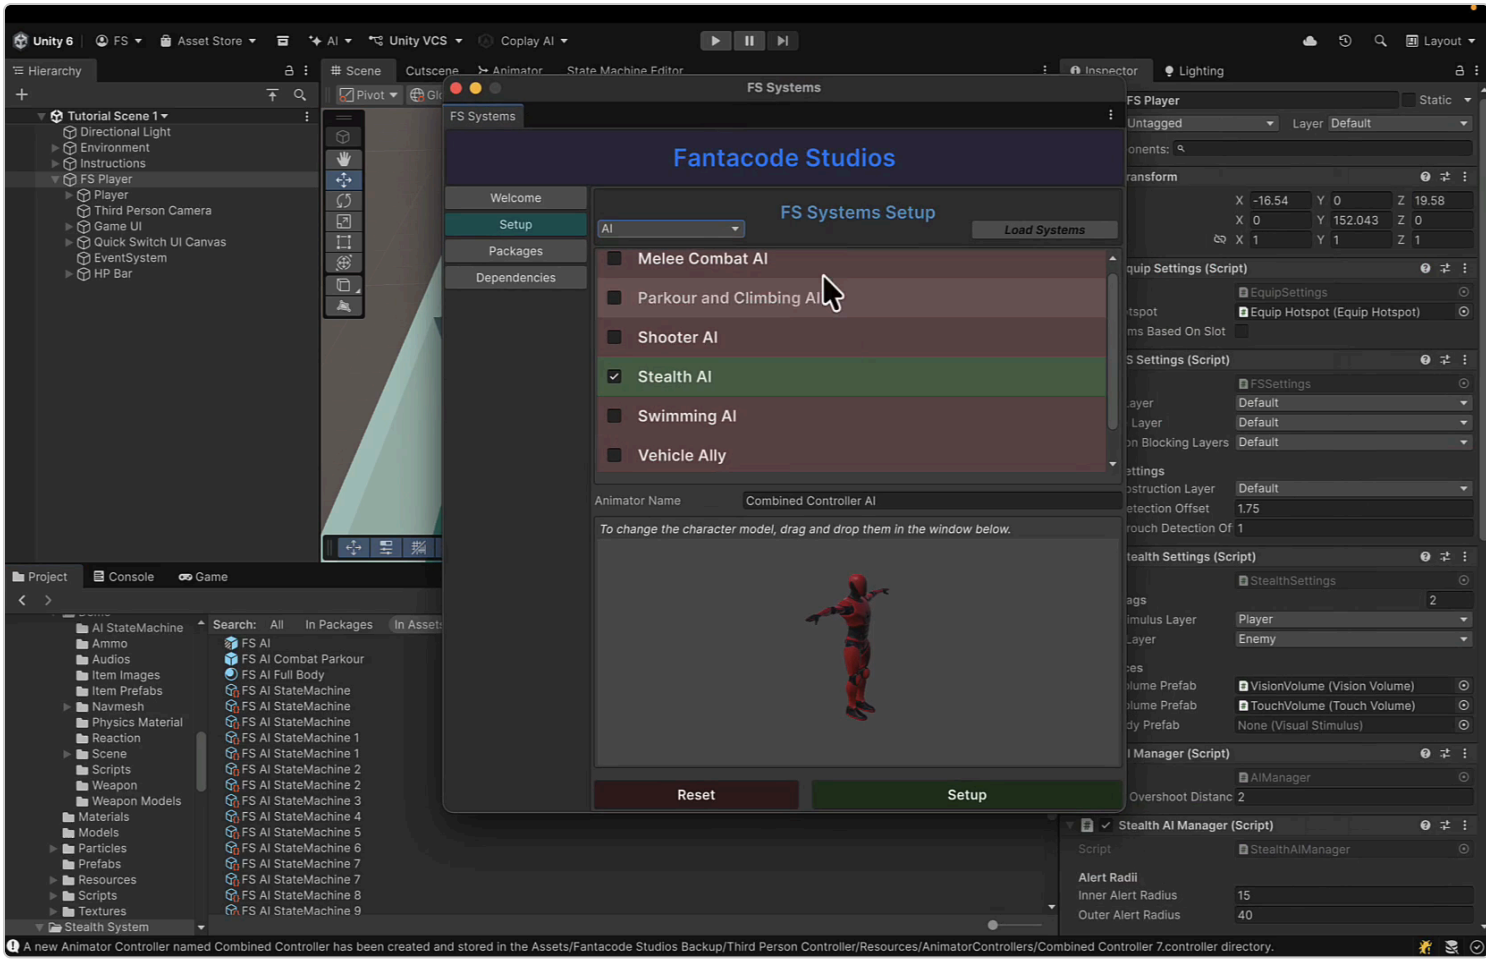

Switching the setup window from Player to AI

3. Select **Stealth AI** from the list.

4. Optionally, change the character model. Here we use a different variant of the default character so the enemy is easy to tell apart from the player.

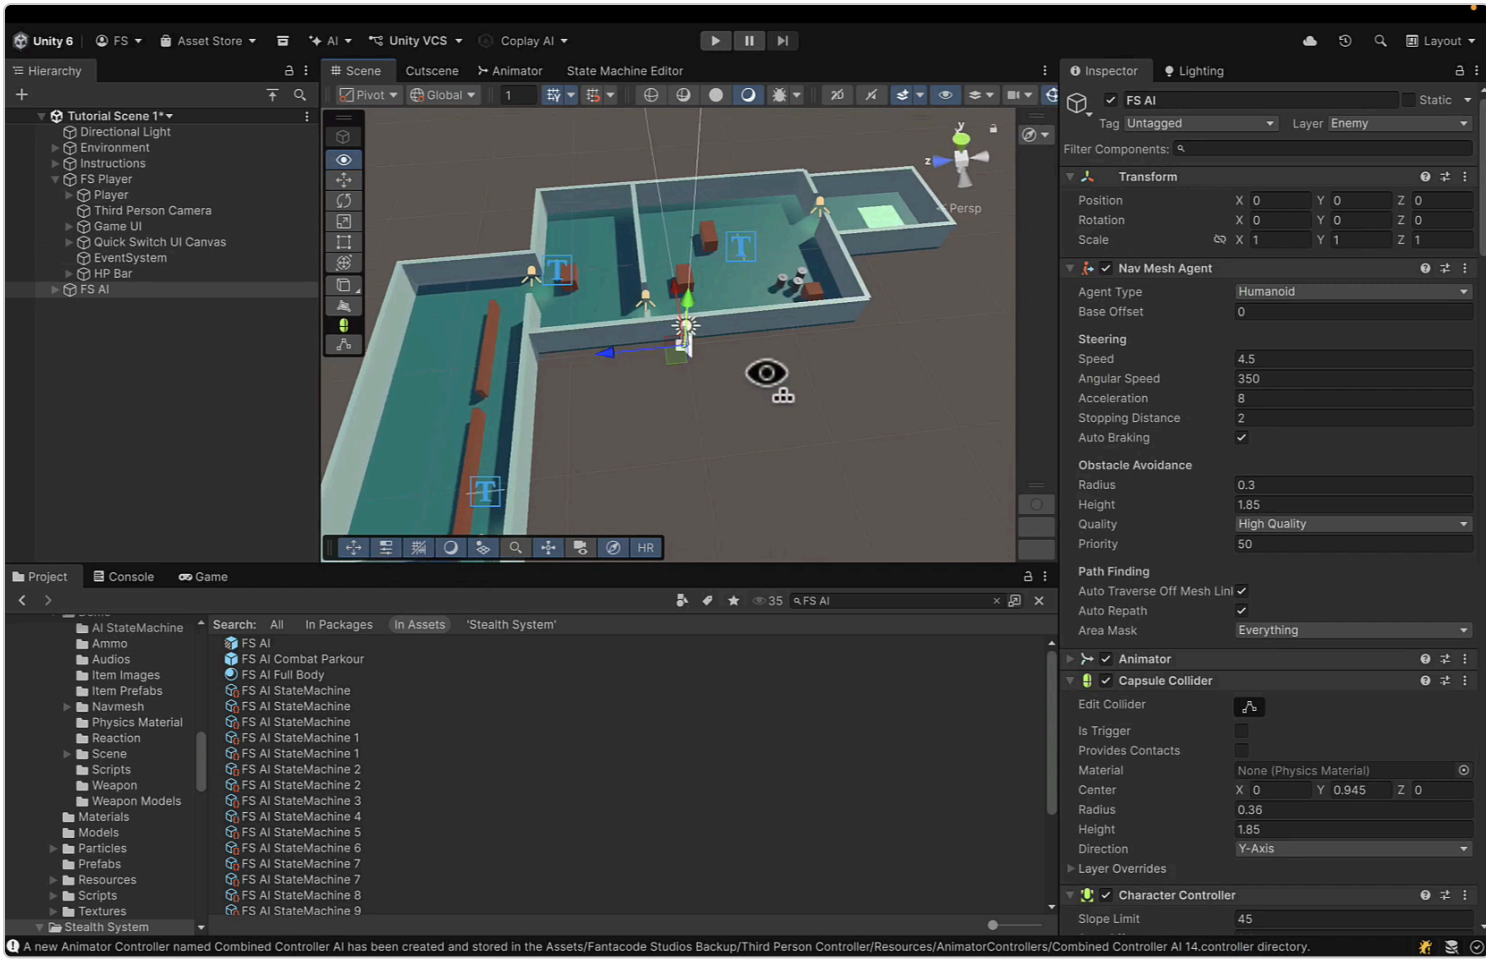

5. Click **Setup**.

Stealth AI selected with a different character model variant

This creates the AI character with everything it needs, including a **NavMeshAgent** for movement.

6. As with the player, position and rotate the AI where you want it in the scene.

Baking the NavMesh

For the AI to move around the scene, the environment needs a baked NavMesh.

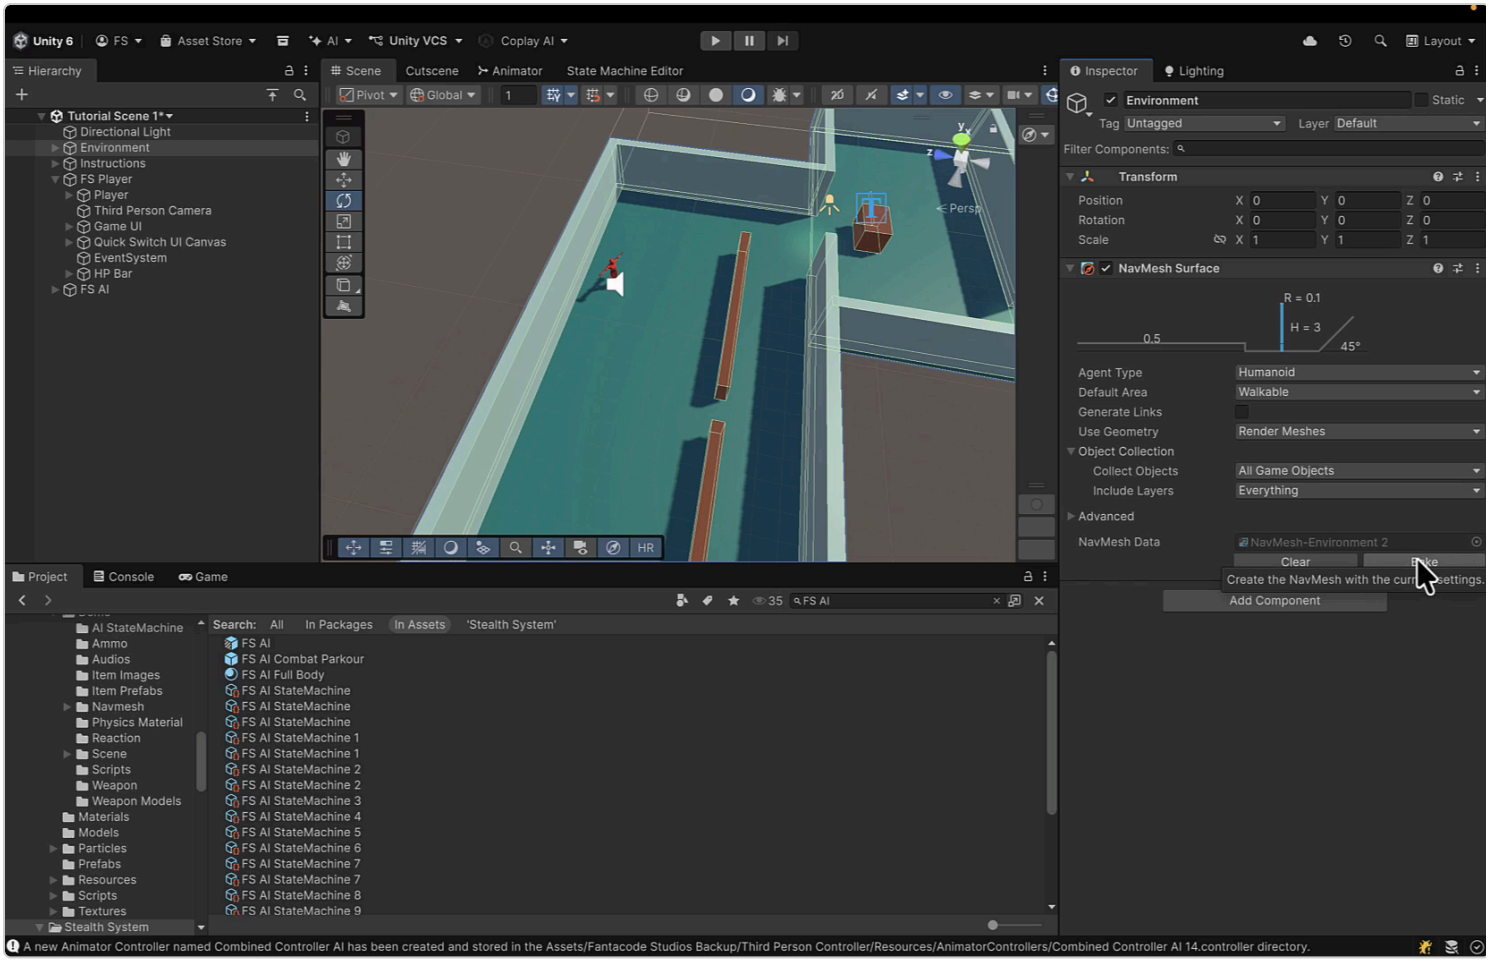

1. Select your environment object in the Hierarchy.

2. Click **Add Component** in the Inspector and add a **NavMesh Surface** component.

Adding a NavMesh Surface component to the environment

3. Click **Bake** on the NavMesh Surface component.

Baking the NavMesh

Once baked, AI characters can navigate the scene.

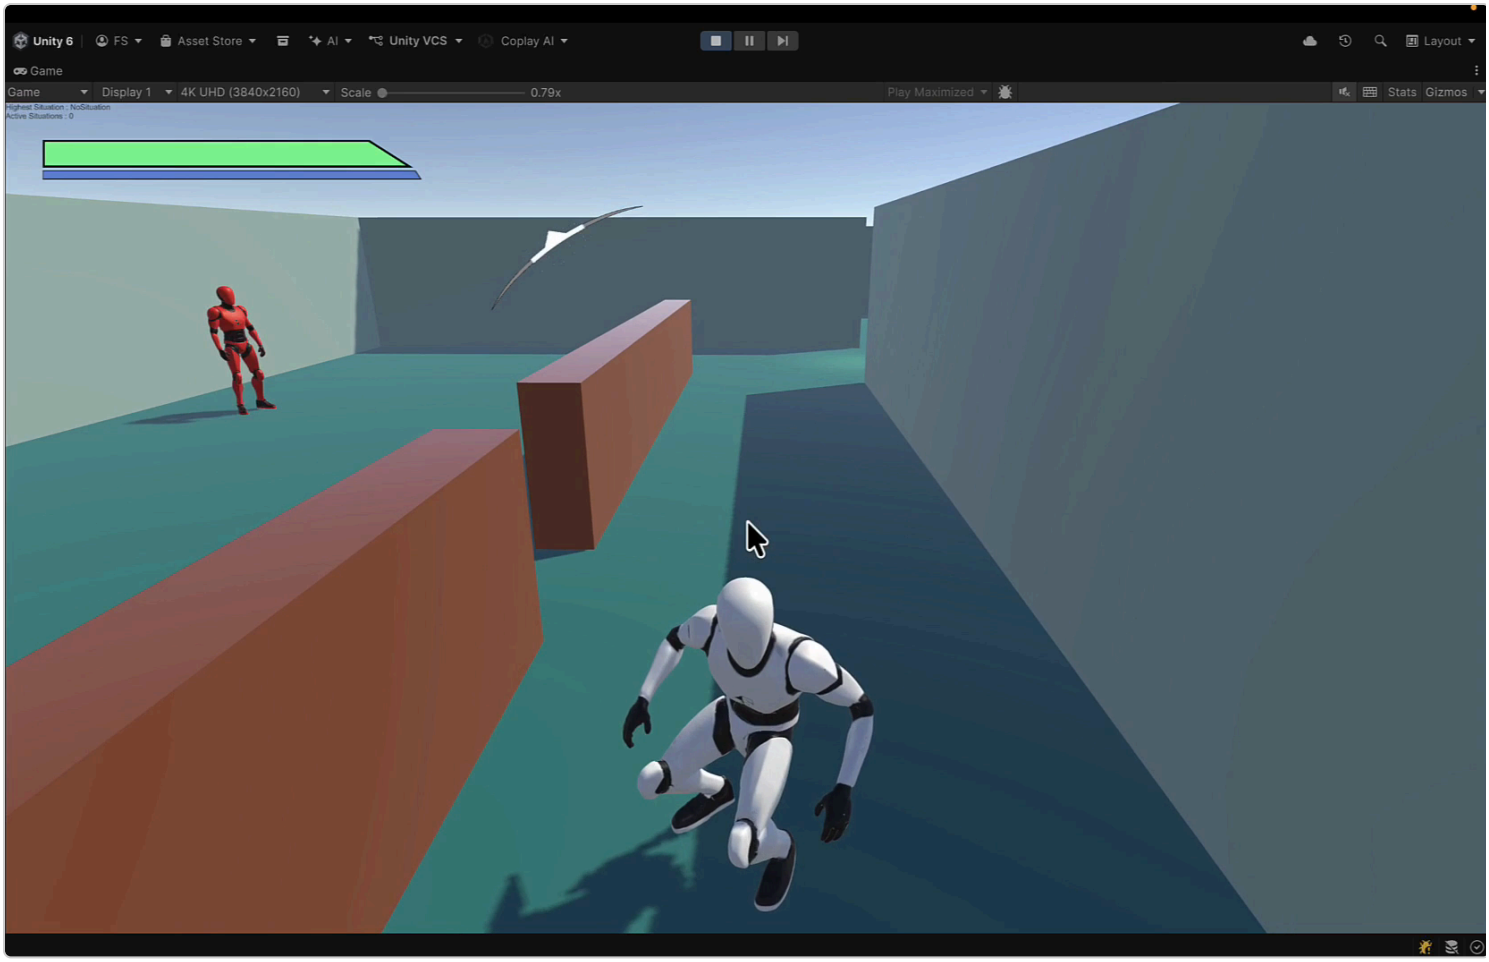

Testing Detection

Enter play mode to see the AI's detection behavior in action.

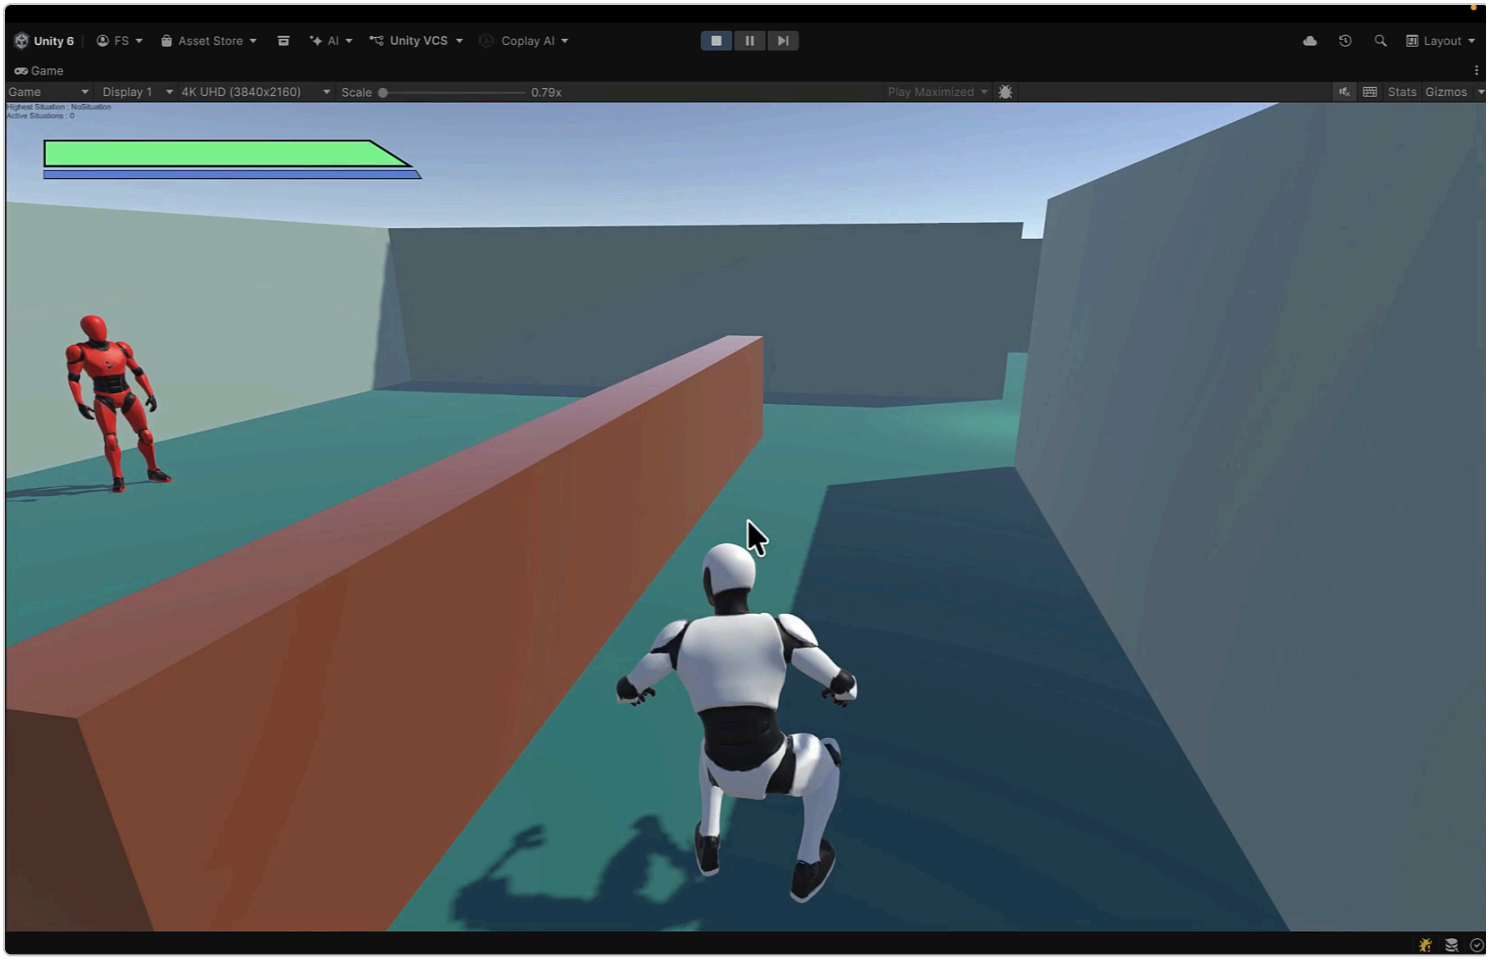

Testing in play mode

Walk into the AI's field of view. While you're in its line of sight, the AI's awareness steadily increases — shown by the indicator above its head filling up. If you break line of sight, the awareness starts to decrease again.

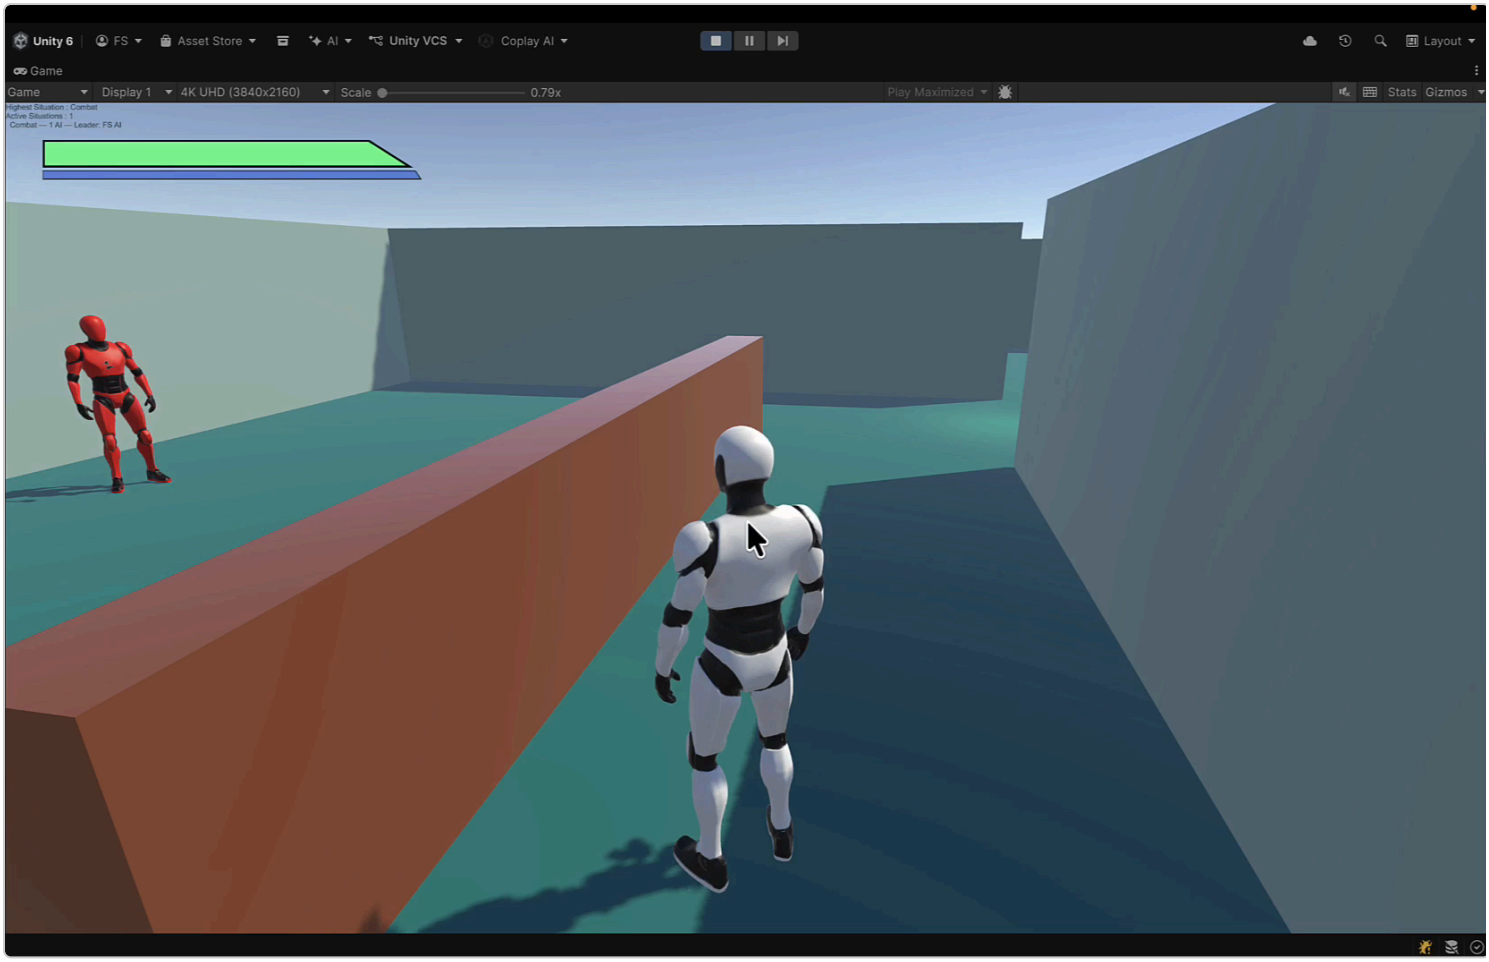

Awareness increasing while the player is in the AI's line of sight

Crouching lets you stay hidden behind low cover: the obstacle blocks the AI's line of sight, so the AI can't detect you.

Crouching behind cover blocks the AI's line of sight

If you stand up while the AI is looking your way, you re-enter its line of sight and its awareness rises again. When awareness fills completely, the AI detects the player.

Standing in view — the AI detects the player

Right now nothing happens after detection: normally the AI would enter a combat state once it detects the player, but we haven't integrated a combat system yet. That's covered in the full Getting Started guide.
